

Gause, Luckinbill, Veilleux, and *What to Do*

Christopher X Jon Jensen
Stony Brook University

Alternative Models of Predation:

Functional Responses:

$$f(N) \longleftrightarrow f(N/P)$$

*“Prey
Dependent”*

*“Ratio
Dependent”*

Possible Outcomes of a Predator-Prey System:

- 1) Complete consumption of prey followed by starvation of the predator (“**Dual Extinction**”).
- 2) Oscillatory or non-oscillatory coexistence of predator and prey (“**Coexistence**”).
- 3) Starvation of the predator followed by ‘escape’ of the prey (“**Predator Extinction**”).

The *Paramecium-Didinium* system:

Paramecium caudatum

Didinium nasutum

Meets major assumptions of simple predator-prey models:

- Closed system
- Can be maintained without heterogeneities/refugia
- Single prey/single obligate predator
- Prey food can be delivered as semi-continuous input

Gause 1934:

Expected:

Lotka-Volterra theory predicted that all predator-prey systems should cycle indefinitely

Actual:

Gause found that he could not prevent his predators from completely consuming the prey population

Luckinbill 1973:

Coexistence can be produced under two conditions:

1. Reduced interaction between predator and prey
2. Reduced prey food availability

Veilleux 1979:

Parameter Changes			Food Concentration	Number of Runs	System Outcome
High r	high a	high e	1.80	17	Dual Extinction
↓	↓	↓	1.58	9	Dual Extinction (6x) and Predator Extinction (3x)
			1.35	18	Predator Extinction
			0.68 to 1.13	50	Coexistence
Low r	low a	low e	0.18 to 0.45	20	Predator Extinction

Qualitative outcome can be changed through modifications of prey food concentration

What about fitting?

Prey-Dependence: better approximates
Luckinbill 1973 data

Ratio-Dependence: better approximates
Veilleux 1979 data

“Despite their structural difference, the two models can produce very similar temporal dynamics... both models fit very well to the data created by the other model. A good fit alone is therefore a poor indicator whether the used model correctly describes the processes that generated the data.”

(Jost 1998, Jost and Ellner 2000, Jost and Arditi 2001)

What about fitting?

“Given that in real life there would be substantial variation around the respective functions, because of stochastic environmental effects, population censusing errors, and variation in parameters among different ecosystems, we submit that the subtle difference in predictions of the prey- versus ratio-dependent models is minor and would not be detectable using simple regression tests”

(Lundberg and Fryxell 1995)

Possible Outcomes of a Predator-Prey System:

- 1) Dual Extinction
- 2) Coexistence
- 3) Predator Extinction

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow PE$; or $DE \rightarrow CoEx$
$K \downarrow$ (carrying capacity)	$DE \rightarrow CoEx \rightarrow PE$	<i>no change</i>
$r \downarrow$ (prey growth rate)	<i>no change*</i>	$CoEx \rightarrow DE$
$d \downarrow$ (pred. death rate)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$
$e \downarrow$ (conversion eff.)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow CoEx \rightarrow PE$
$h \downarrow$ (handling time)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow PE$; or $DE \rightarrow CoEx$
$K \downarrow$ (carrying capacity)	$DE \rightarrow CoEx \rightarrow PE$	<i>no change</i>
$r \downarrow$ (prey growth rate)	<i>no change*</i>	$CoEx \rightarrow DE$
$d \downarrow$ (pred. death rate)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$
$e \downarrow$ (conversion eff.)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow CoEx \rightarrow PE$
$h \downarrow$ (handling time)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow PE; or DE \rightarrow CoEx
$K \downarrow$ (carrying capacity)	DE \rightarrow CoEx \rightarrow PE	<i>no change</i>
$r \downarrow$ (prey growth rate)	<i>no change*</i>	CoEx \rightarrow DE
$d \downarrow$ (pred. death rate)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE
$e \downarrow$ (conversion eff.)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow CoEx \rightarrow PE
$h \downarrow$ (handling time)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow PE; or DE \rightarrow CoEx
$K \downarrow$ (carrying capacity)	DE \rightarrow CoEx \rightarrow PE	<i>no change</i>
$r \downarrow$ (prey growth rate)	<i>no change*</i>	CoEx \rightarrow DE
$d \downarrow$ (pred. death rate)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE
$e \downarrow$ (conversion eff.)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow CoEx \rightarrow PE
$h \downarrow$ (handling time)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow PE; or DE \rightarrow CoEx
$K \downarrow$ (carrying capacity)	DE \rightarrow CoEx \rightarrow PE	<i>no change</i>
$r \downarrow$ (prey growth rate)	DE \rightarrow CoEx*	CoEx \rightarrow DE
$d \downarrow$ (pred. death rate)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE
$e \downarrow$ (conversion eff.)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow CoEx \rightarrow PE
$h \downarrow$ (handling time)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow PE$; or $DE \rightarrow CoEx$
$K \downarrow$ (carrying capacity)	$DE \rightarrow CoEx \rightarrow PE$	<i>no change</i>
$r \downarrow$ (prey growth rate)	$DE \rightarrow CoEx^*$	$CoEx \rightarrow DE$
$d \downarrow$ (pred. death rate)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$
$e \downarrow$ (conversion eff.)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow CoEx \rightarrow PE$
$h \downarrow$ (handling time)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow PE$; or $DE \rightarrow CoEx$
$K \downarrow$ (carrying capacity)	$DE \rightarrow CoEx \rightarrow PE$	<i>no change</i>
$r \downarrow$ (prey growth rate)	$DE \rightarrow CoEx^*$	$CoEx \rightarrow DE$
$d \downarrow$ (pred. death rate)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$
$e \downarrow$ (conversion eff.)	$DE \rightarrow CoEx \rightarrow PE$	$DE \rightarrow CoEx \rightarrow PE$
$h \downarrow$ (handling time)	$PE \rightarrow CoEx \rightarrow DE$	$PE \rightarrow CoEx \rightarrow DE$

**Proportional removal of prey
will decrease r & K without
changing other parameters:**

$$dN/dt = r_0 N (1 - N/K) - pN$$

$$r_p = (r_0 - p)$$

$$K_p = K(1 - p/r_0)$$

Comparison of prey- vs. ratio dependent outcomes:

Change in Parameter	Prey-Dependent Outcome	Ratio-Dependent Outcome
$a \downarrow$ (searching efficiency)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow PE; or DE \rightarrow CoEx
Increasing levels of enforced proportional mortality (p)	DE \rightarrow CoEx \rightarrow PE	CoEx \rightarrow DE
$d \downarrow$ (pred. death rate)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE
$e \downarrow$ (conversion eff.)	DE \rightarrow CoEx \rightarrow PE	DE \rightarrow CoEx \rightarrow PE
$h \downarrow$ (handling time)	PE \rightarrow CoEx \rightarrow DE	PE \rightarrow CoEx \rightarrow DE

Experiment: *PoE in reverse*

H_P = increasing p (*i.e.* reducing K) in a stable system should **maintain stability**.

[prey-dependent prediction]

H_R = increasing p (*i.e.* reducing r) in a stable system should **destabilize the system**.

[ratio-dependent prediction]

Experiment: *PoE forward*

H_R = decreasing p (*i.e.* increasing r) in a stable system should **maintain stability**.

[ratio-dependent prediction]

H_P = decreasing p (*i.e.* increasing K) in a stable system should **destabilize the system**.

[prey-dependent prediction]

Experiment: *PoE in reverse*

1. Using manipulations of methyl cellulose and prey nutrient input, find conditions under which long-term coexistence occurs
2. Impose proportional mortality of prey in as continuous a manner as possible
3. Continue to increase proportional mortality until *dual extinction* can be achieved
4. If dual extinction occurs, use a prey-only system with the same conditions to determine if the proportional mortality level at which *dual extinction* occurs corresponds to $r < 0$ or $r > 0$

Experiment: *PoE forward*

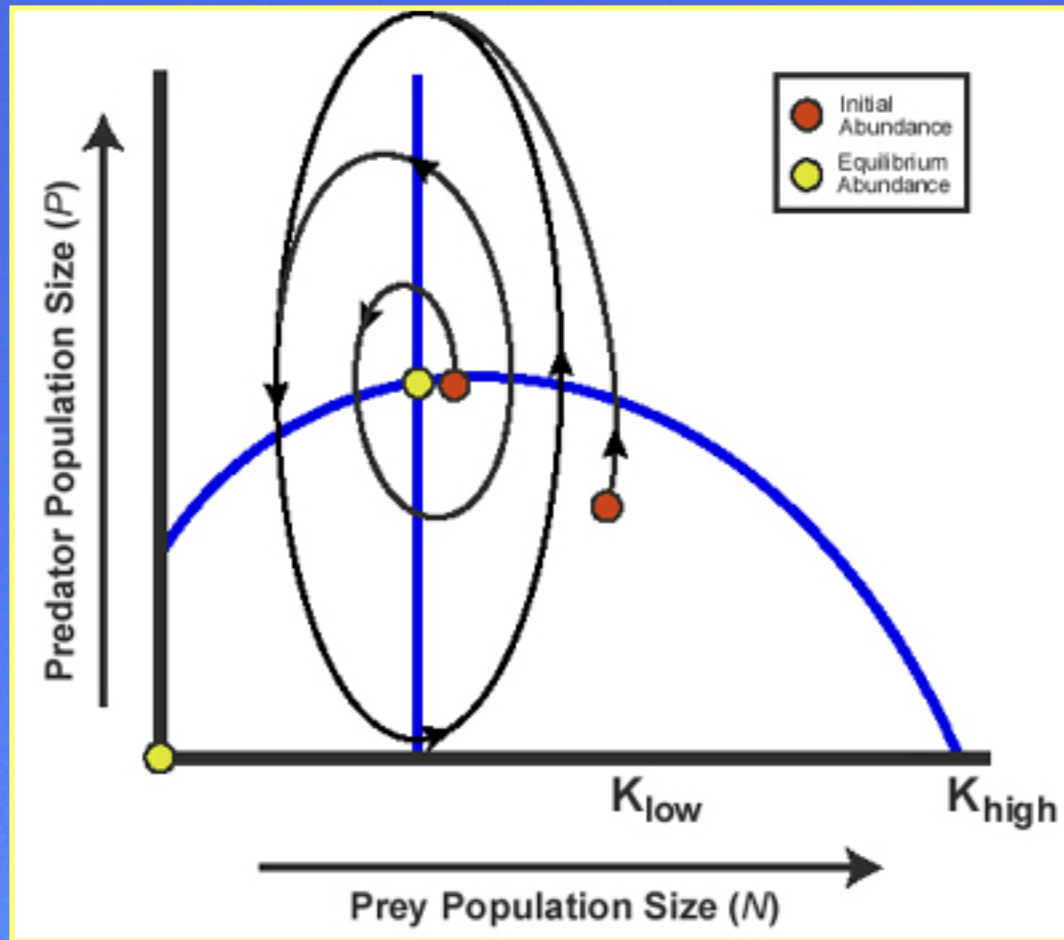

1. Begin with a system where high proportional mortality is being enforced
2. Using manipulations of methyl cellulose and prey nutrient input, find conditions under which long-term coexistence occurs
3. Increase r by incrementally releasing the system from enforced proportional mortality
4. Continue to decrease proportional mortality until *dual extinction* can be achieved
5. Note the problem here with having to prove the absence of a phenomenon
